**Topic: Challenges of the Future**

The balance between the global supply and demand for crude oil is becoming progressively tighter, increasingly requiring our industry to face new and unique challenges. Our industry of tomorrow will have to address the demands of operating in adverse environment, development of new technologies and expediting implementation in the field, as well as optimization of processes and enhancing collaborative efforts to reduce cost.

This presentation provides an overview of initiatives that must be directed at addressing the key issues as well as SPE's engagement in facilitating the industry dialogue on global exchange of knowledge.

## **TECHNICAL SESSION**

Notice how the solids on the Conventional API pump are **funneled outward** into the gap between the plunger connector and the pump barrel wall. This will cause the API plunger to stick in the barrel and/or shorten its run life.

In comparison, notice how the solids in the "FARR™" pump are **channeled inward**, keeping solids in solution at all times, thus not letting them between the plunger and barrel wall.

The FARR™ Plunger will stay in the ground 3 to 6 times longer than a Conventional API plunger.

We are the original open top plunger and can handle any kind of solids. We can pump formation sand, frac sand, scale, iron sulfide, grit, flour sand, and other fines. We named the FARR™ Plunger the "FARR™" because it will far out perform and far out last all others plungers in the industry.
